If you wear contact lenses, remove them first, then wait 15 minutes after using your eyedrops before you put them back into your eyes.

Follow these 5 steps to ensure you use your eyedrops correctly:

1. Wash your hands. Tilt your head back and look at the ceiling.*
2. Using your index finger, gently pull down your lower eyelid to form a pocket.
3. Gently squeeze 1 drop into the pocket. Do not let the bottle tip touch your eye, your fingers, or anything else.
4. Gently close your eyes and lightly press on the inside corners of your eyes.
5. Then carefully blot away any excess liquid that may be on your skin.

*If you wear contact lenses, remove them first, then wait 15 minutes after using your eyedrops before you put them back into your eyes.
Glaucoma may affect your vision if left untreated

- Glaucoma is a serious eye disease that is defined by high pressure inside the eye
- High eye pressure (also known as intraocular pressure, or IOP) can slowly damage your optic nerve and lead to permanent vision loss
- There are various ways to lower high eye pressure like surgery, implants, and taking eyedrops
- Lowering high eye pressure has been shown to reduce the risk of vision loss
